

User Story

- John Deer office - show all inventory, all orders that are coming in, in some graph/figure/table - 12 month back data - what ur orders will be like, 2-3 month in advance - what to order, always have enough supplies to create, not too much
- When things break - to fix them

postgres
- inventory storage
- tables:
1. customer_orders
2. supply_orders
- date_ordered, promised_date, fulfilled_date
3. customers
4. production_pipeline
5. inventory_part
- broken, broken_date

Order form
- fields: customer_id, tractor_quantity, id (PK)

show all inventory dashboard
- shows all customers orders
- ability to "order" all parts for orders
- filter/tabs for 12 month backlog
- customizable/or hard coded (2-3 month) time frame for "production_pipeline"

Worker queue for ordered supplies
- Home Depot API order supply
- Asynchronously
- Can have multiple suppliers to see available inventory

Model for tracking supplier delays
- based on customer history/data based on fulfilled_date vs promised_date
- manual contact suppliers for delays

Model for predicting demand fluctuations
- Based on customer history/data + market data/rates/economical index + seasonal

Model for predicting component failures
- based on inventory history - broken, broken_date

Model for predicting cost effective inventory strategies
- Based on order history/data + market data/rates/economical index + seasonal, demand vs supply, etc

LLM usage for predicting
- Chatbot within dashboard that takes the same data/model from
- Weekly job to give a summary on dashboard

customer order API
- GET

place supply/parts order API
- POST

Chatbot API
- Asked
- Streaming
